\mathbb{A}^1 -INVARIANCE FOR UNSTABLE K_2

S. SINCHUK, A. STAVROVA, AND A. LAVRENOV

1. AIM OF THE PAPER

The aim of this text is to prove that the non-stable K_2 -functors K_2^G , where G is a simply connected Chevalley group of suitable type, satisfy \mathbb{A}^1 -invariance on regular rings R containing a field k, that is,

{eq:A1-main}

(1.1)
$$K_2^G(R[t]) = K_2^G(R).$$

As a corollary, we should easily deduce that

$$K_2^G(R) = KV_2^G(R),$$

where $KV_2^G(R)$ is the Karoubi–Villamayor K-functor associated to G. This functor originates from [Jar83]. The above equality by e.g. [AHW15, Corollary 4.3.3] implies that $\pi_1^{\mathbb{A}^1}(G)(R) = K_2^G(R)$, i.e. we obtain an explicit presentation for the \mathbb{A}^1 -fundamental group of G in the sense of Morel–Voevodsky.

"Suitable type" here means that we consider only the cases where we know the centrality of K_2 , or at least the Quillen-Suslin lgp. Some intermediate steps can be proved in larger generality.

Essentially, we need to prove that $K_2^G(k[x_1,\ldots,x_n])=K_2^G(k)$. (Then (1.1) follows by standard geometric methods.) There are two models: Tulenbaev's proof for the SL_n case [Tul83] and Stavrova's proof for K_1^G [Sta14]. Tulenbaev [Tul83] uses stabilization of the K_2 -functor, and the good properties of the limit=algebraic K-theory. In [Sta14] stabilization is not used. However, the key steps of both proofs are the same: the case of R=k (hidden somewhere around [Tul83, p. 140], or, respectively, [Sta14, Theorem 3.1]); Quillen-Suslin lgp; \mathbb{P}^1 -gluing (see [Tul83, Theorem 5.1] or [Sta14, Theorem 1.1]).

1.1. The case R = k. We consider the case of $K_2^G(k[t])$ vs. $K_2^G(k)$. (As in the \mathbb{A}^1 -invariance of K_1^G , this case should be used to deduce that $K_2^G(k[t_1,\ldots,t_n]) = K_2^G(k)$.)

In Tulenbaev's framework, it follows from stabilization. However, the equality $K_2^G(k[t]) = K_2^G(k)$ is sort of known for all groups. Namely, in [Wen14, Theorem 5.1]: let k be an infinite field and let G be a connected reductive group over k. Then the inclusion $k \hookrightarrow k[t]$ induces an isomorphism

$$H_{\bullet}(G(k), \mathbb{Z}) \xrightarrow{\cong} H_{\bullet}(G(k[t]), \mathbb{Z}),$$

if the order of the fundamental group of G is invertible in k. Once we know that the homology H_2 coincides with K_2^G (on both sides), this gives the result. It would be nice to check Wendt's proof; maybe, discuss it in a seminar?

Is it necessary to know the centrality in order to show that K_2^G coincides with H_2 ? If yes, then we probably know it for $K_2^G(k)$ even for isotropic groups [Deo78], but only for the

²⁰¹⁰ Mathematics Subject Classification. 19C09, 19C20, 14L15, 20G35.

Key words and phrases. Chevalley group, non-stable K_2 -functor, Steinberg group.

good Chevalley groups for $K_2^G(k[t])$. We should try to understand what is proved in [VW12, Proposition 5.3 using only the universality of the Steinberg group. This may be useful. The paper is unpublished, so again everything should be double-checked if you want to refer to it.

1.2. Plan of the proof.

plan:3t

(1) (done, see Theorem 1). Let R be a local ring. Show that

$$\operatorname{St}^{\operatorname{G}}(R[t^{\pm 1}]) = i_{+}(\operatorname{St}^{\operatorname{G}}(R[t]))i_{-}(\operatorname{St}^{\operatorname{G}}(R[t^{-1}]))i_{+}(\operatorname{St}^{\operatorname{G}}(R[t]))$$

Here i_{\pm} denote the natural homomorphisms into $\mathrm{St}^{\mathrm{G}}(R[t^{\pm 1}])$.

(2) (done, see Theorem 3). Show that $K_2^G(k[t]) = K_2^G(k)$.

(3) (done). Consequently, $\operatorname{St}^{\operatorname{G}}(k[t]) \to \operatorname{St}^{\operatorname{G}}(k[t^{\pm 1}])$ is injective and $\operatorname{St}^{\operatorname{G}}(k[t]) \cap \operatorname{St}^{\operatorname{G}}(k[t^{-1}]) =$ $St^{G}(k)$ inside $St^{G}(k[t^{\pm 1}])$. Also, $K_{2}^{G}(k) = K_{2}^{G}(k[t^{\pm 1}])$.

The first claim uses (2). The second claim follows from (2) and (1).

(4) (**done** for split ACDE, see Theorem 2). Prove Quillen-Suslin lgp for K_2^G .

(5) (Zariski gluing) for any commutative ring A and any non-nilpotent $f, g \in A$ such that A = fA + gA, the sequence of pointed sets

$$1 \longrightarrow K_2^G(A) \xrightarrow{g \mapsto (g,g)} K_2^G(A_f) \times K_2^G(A_g) \xrightarrow{(g_1,g_2) \mapsto g_1g_2^{-1}} K_2^G(A_{fg})$$

is exact. The proof is usually almost the same as for (4).

(Remark. It seems that we need this property only for A = R[t] and f, g nonconstant polynomials.)

(6) (S-lemma) Let A be a commutative ring, S a multiplicative subset of A. If

$$K_2^G(A[X_1,\ldots,X_n]) = K_2^G(A)$$

for some $n \geq 1$, then $K_2^G(A_S[X_1, \ldots, X_n]) = K_2^G(A_S)$ as well.

This should be easy; see [Abe83, Lemma 3.6].

(7) (Nisnevich gluing) Assume that B is a subring of a commutative ring A, and let $h \in B$ be a non-nilpotent element. Denote by $F_h:A\to A_h$ the localization homomorphism.

(i) If Ah + B = A, i.e. the natural map $B \to A/Ah$ is surjective, then for any $x \in \mathrm{St}^{\mathrm{G}}(A_h)$ there exist $y \in \mathrm{St}^{\mathrm{G}}(A)$ and $z \in \mathrm{St}^{\mathrm{G}}(B_h)$ such that $x = F_h(y)z$.

(ii) If moreover $Ah \cap B = Bh$, i.e. $B/Bh \to A/Ah$ is an isomorphism, and h is not a zero divisor in A, then the sequence of pointed sets

$$K_2^G(B) \xrightarrow{g \mapsto (F_h(g),g)} K_2^G(B_h) \times K_2^G(A) \xrightarrow{(g_1,g_2) \mapsto g_1 F_h(g_2)^{-1}} K_2^G(A_h)$$

is exact.

This should use something from the proof of (4) or (5); see [Sta14, Lemma 3.4].

(8) (\mathbb{P}^1 -gluing) Let A be any commutative ring. Show that the sequence of pointed sets

$$1 \longrightarrow K_2^G(A) \xrightarrow{g \mapsto (g,g)} K_2^G(A[t]) \times K_2^G(A[t^{-1}]) \xrightarrow{(g_1,g_2) \mapsto g_1g_2^{-1}} K_2^G(A[t,t^{-1}])$$

is exact.

This should use (1)–(4).

- (a) (done) Prove Corollary 6.2.
- (b) Prove Proposition 6.1. This is hard. Have no idea how this can be proved at the moment.
- (c) Prove \mathbb{P}^1 -glueing using all the above facts.

plan:k[t] n:k-intersect

> plan:QSlgp plan:Zglu

plan:S-lemma

plan:Nglu

plan:P1

plan:[]f

(9) (Main corollary of \mathbb{P}^1 -gluing) Let A be any commutative ring, and let $f \in A[t]$ be a monic polynomial. Show that $K_2^G(A[t]) \to K_2^G(A[t]_f)$ is injective. The proof uses (5) and (8).

plan:k(t)

(10) Prove that $K_2^G(k(t)) = K_2^G(k)$. This may be a bit tricky; I will think if we can get rid of it. I don't think Tulenbaev uses it. Unsure whether this is true (?). This is true for SK_1 but in view of Milnor's theorem can not hold for K_1 and K_2 .

plan:k[tn]

(11) Prove that

$$K_2^G(k[t_1,\ldots,t_n]) = K_2^G(k).$$

If we strictly follow the pattern of K_1^G , this uses (9), (2), and (10). There may be other ways.

plan:final

- (12) Final result: let R be a regular ring containing a field k. Then $K_2^G(R[t]) = K_2^G(R)$. This uses (4), (11) and (7).
 - 2. Steinberg groups of Chevalley groups: preliminaries

Definition, functoriality, "congruence subgroups" $\operatorname{St}^{\operatorname{G}}(\Phi, R, I)$ versus $\ker(\operatorname{St}^{\operatorname{G}}(\Phi, R) \to \operatorname{St}^{\operatorname{G}}(\Phi, R/I))$.

2.1. **Tulenbaev's lifting property.** The following property of linear Steinberg groups was discovered for the first time by Tulenbaev (see [Tul83, Lemmas 2.3, 3.2]) and plays a key role in the sequel.

def:tlp

Definition 2.1. We say that the Steinberg group functor St^G satisfies *Tulenbaev's lifting* property if for every pair (R, I) and every nonnilpotent $a \in R$ such that the localization map of modules $\lambda_a \colon I \to I_a$ is an isomorphism the following lifting problem has a solution.

$$\operatorname{St}^{G}(R, I) \xrightarrow{\mu} \operatorname{St}^{G}(R)$$

$$\downarrow^{\lambda_{a}^{*}} \qquad \downarrow^{\lambda_{a}^{*}}$$

$$\operatorname{St}^{G}(R_{a}, I) \xrightarrow{\mu} \operatorname{St}^{G}(R_{a})$$

3. Decomposition theorems for $\mathrm{St}^{\mathrm{G}}(A[t^{\pm 1}])$ and $\mathrm{St}^{\mathrm{G}}(A((t)))$.

Lemma 3.1. Let (R, m) be a local ring, and let G be a simply connected simple group over R of isotropic rank ≥ 2 . Let $i_+: \operatorname{St}^G(R[t]) \to \operatorname{St}^G(R[t^{\pm 1}])$ and $i_-: \operatorname{St}^G(R[t^{-1}] \to \operatorname{St}^G(R[t^{\pm 1}])$ be the natural homomorphisms. Then

$$i_{+}(\operatorname{St}^{G}(m \cdot R[t])^{\operatorname{St}^{G}(R[t])})i_{-}(\operatorname{St}^{G}(R[t^{-1}]) = i_{-}(\operatorname{St}^{G}(R[t^{-1}])i_{+}(\operatorname{St}^{G}(m \cdot R[t])^{\operatorname{St}^{G}(R[t])})$$

inside $\operatorname{St}^{G}(R[t^{\pm 1}])$.

Proof. This is proved exactly as [Sta14, Lemma 5.12].

thm:3t

Theorem 1. Let R be a local ring, and let G be a simply connected simple group over R of isotropic rank ≥ 2 . Let $i_+: \operatorname{St}^G(R[t]) \to \operatorname{St}^G(R[t^{\pm 1}])$ and $i_-: \operatorname{St}^G(R[t^{-1}] \to \operatorname{St}^G(R[t^{\pm 1}])$ be the natural homomorphisms. Then

$$\operatorname{St}^{G}(R[t^{\pm 1}]) = i_{+}(\operatorname{St}^{G}(R[t]))i_{-}(\operatorname{St}^{G}(R[t^{-1}]))i_{+}(\operatorname{St}^{G}(R[t])).$$

Proof. This is proved exactly as [Sta14, Theorem 5.1].

4. Quillen-Suslin Lgp, Zariski gluing, Nisnevich gluing, S-lemma

thm:lg-k2

Theorem 2. Assume that the Steinberg group functor St^G satisfies Tulenbaev's lifting property (cf. Definition 2.1). Then an element $g \in \operatorname{St}^G(R[t], tR[t])$ is trivial if and only if its image in $\operatorname{St}^G(R_M[t], tR_M[t])$ is trivial for all maximal ideals $M \leq R$.

Proof. Follows by the same argument as [Tul83, Theorem 2.1] or [Sin16, Theorem 2]

5. The case of $K_2^G(k[t])$ and some corollaries

Let $G = G(\Phi, -)$ be the simply-connected Chevalley—Demazure group scheme of type Φ . Recall that for $\alpha \in \Phi$, $\varepsilon \in R^*$ the semisimple root elements $h_{\alpha}(\varepsilon)$ are defined as $h_{\alpha}(\varepsilon) = w_{\alpha}(\varepsilon)w_{\alpha}(-1)$.

thm:k[t]

Theorem 3. Let k be a field. Assuming that Φ is irreducible of rank at least 2 the following facts are true.

satz1

(i) For A = k, k[t] the subgroup $K_2^G(A) \leq \operatorname{St}^G(A)$ is generated by elements of the form

$$h_{\alpha}(uv)h_{\alpha}(u)^{-1}h_{\alpha}(v)^{-1}, \ u, v \in k^*.$$

(ii) As a consequence, the canonical map $K_2^G(k) \hookrightarrow K_2^G(k[t])$ is an isomorphism.

Proof. See [Reh75, Satz 1] and the corollary after it.

cor:k[t]inj

Corollary 5.1. Let G, k be as in Theorem 3. Then $St^{G}(k[t]) \to St^{G}(k[t^{\pm 1}])$ is injective and $St^{G}(k[t]) \cap St^{G}(k[t^{-1}]) = St^{G}(k)$ inside $St^{G}(k[t^{\pm 1}])$.

Proof. Clearly, $g \in \ker(\operatorname{St}^G(k[t]) \to \operatorname{St}^G(k[t^{\pm 1}]))$ implies $g \in K_2^G(k[t])$. Since $K_2^G(k[t]) = K_2^G(k)$, and there is a section $K_2^G(k[t^{\pm 1}]) \to K_2^G(k)$, the map is injective. Second claim: take $g \in \operatorname{St}^G(k[t]) \cap \operatorname{St}^G(k[t^{-1}])$. Then the image $\phi(g)$ belongs to $E(k) = E(k[t]) \cap E(k[t^{-1}])$, and after adjusting g by an element of $\operatorname{St}^G(k)$, we can assume that $g \in K_2^G(k[t]) \cap K_2^G(k[t^{-1}])$. Hence $g \in K_2^G(k) \subseteq \operatorname{St}^G(k)$.

Corollary 5.2. Let G, k be as in Theorem 3. Then $K_2^G(k[t^{\pm 1}]) = K_2^G(k)$.

Proof. We use Theorem 1. Take $g \in K_2^G(k[t^{\pm 1}])$, then $g = x_1yx_2, x_i \in St^G(k[t])$, $y \in St^G(k[t^{-1}])$. Since $E(k[t]) \cap E(k[t^{-1}]) = E(k)$, we have $y \in St^G(k)K_2^G(k[t^{-1}]) = St^G(k)$ and $x_1x_2 \in St^G(k)$. That is, $g \in K_2^G(k)$. □

Denote by $W(\Phi, R)$ the subgroup of $St(\Phi, R)$ generated by all elements $w_{\alpha}(\varepsilon)$, $\varepsilon \in R^*$. The following result is a Steinberg level analogue of the well-known Bruhat decomposition.

cor:bruhat

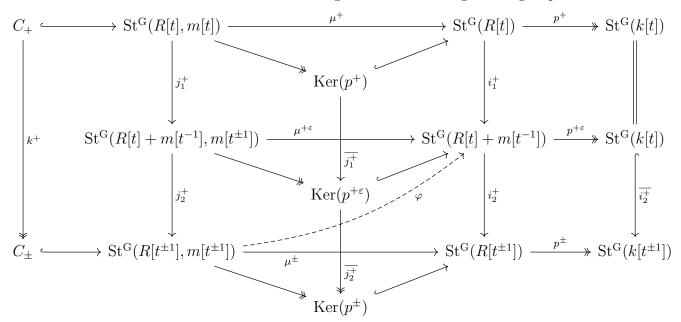

Corollary 5.3. For Φ of rank ≥ 2 and a field k one has

$$\operatorname{St}(\Phi, k) = \operatorname{U}(\Phi^+, k) \cdot \operatorname{W}(\Phi, k) \cdot \operatorname{U}(\Phi^+, k).$$

Proof. From Theorem 3.(i) it follows that $K_2(\Phi, k)$ is contained in $W(\Phi, k)$, therefore the reqired assertion follows from the classical Bruhat decomposition (see e.g. [SFW67, Theorem 4]). For a direct proof in the linear case see also [HO89, § 2.3A].

6. \mathbb{P}^1 -GLUING

6.1. **Preliminaries.** Let R denote arbitrary commutative local ring with the maximal ideal m and the residue field k. Consider the following commutative diagram of groups.

ılKernSurject

Proposition 6.1. The map k^+ is surjective.

Proof. First of all, notice that using Tulenbaev's lifting property 2.1 we find a map φ such that $i_2^+\varphi=\mu^\pm$.

Compare with [Tul83, Proposition 4.1].

cor:TulInj

Corollary 6.2. The map i_2^+ is injective.

Proof. Follows from the above proposition by a simple diagram chasing (cf. [Tul83, Cor. 4.2]). Indeed, let $g \in \operatorname{St}^{G}(R[t] + m[t^{-1}])$ be an element of $\ker(i_{2}^{+})$. By Corollary 5.1 g also lies in $\ker(p^{+\varepsilon})$ and hence comes from some $\widetilde{g} \in \operatorname{St}^{G}(A[t] + m[t^{-1}], m[t^{\pm 1}])$ via $\mu^{+\varepsilon}$. Since $j_{2}^{+}(\widetilde{g})$ lies in C_{\pm} by Proposition 6.1 it comes from some $\widehat{g} \in C_{+}$ via k^{+} . It remains to notice that $g = \mu^{+\varepsilon}(\widetilde{g}) = i_{1}^{+}\mu^{+}(\widehat{g}) = i_{1}^{+}(1) = 1$, as claimed.

6.2. Main result. The following lemma is an analog of [Tul83, Proposition 4.3 (a)].

Lemma 6.3. Let R be a local ring, k = R/m, and let k, G be as in Theorem 3. The natural homomorphism $\operatorname{St}^{G}(R[t]) \to \operatorname{St}^{G}(R[t^{\pm 1}])$ is injective.

Proof. Let I be the maximal ideal of R, l = R/I, and consider the natural maps ρ : $\operatorname{St}^{\operatorname{G}}(R[t,t^{-1}]) \to \operatorname{St}^{\operatorname{G}}(l[t,t^{-1}])$, $\rho_+:\operatorname{St}^{\operatorname{G}}(R[t]) \to \operatorname{St}^{\operatorname{G}}(l[t])$, $\rho_-:\operatorname{St}^{\operatorname{G}}(R[t^{-1}]) \to \operatorname{St}^{\operatorname{G}}(l[t^{-1}])$. Take $x \in \ker(\operatorname{St}^{\operatorname{G}}(R[t]) \to \operatorname{St}^{\operatorname{G}}(R[t^{\pm 1}])$. By the field case Corollary 5.1 one has $\rho_+(x) = 1$, hence $x \in \operatorname{St}^{\operatorname{G}}(I \cdot R[t])^{\operatorname{St}^{\operatorname{G}}(R[t])}$.

Lemma 6.4. Let G, k be as in Theorem 3. Let (R, m) be a local ring such that R/m = k. Then

$$\operatorname{St}^{\operatorname{G}}(R[t]) \cap \operatorname{St}^{\operatorname{G}}(R[t^{-1}]) = \operatorname{St}^{\operatorname{G}}(R)$$

inside $St^G(R[t^{\pm 1}])$.

Proof. ??????

Theorem 4. Let A be any commutative ring. Then the sequence of pointed sets

$$1 \longrightarrow K_2^G(A) \xrightarrow{g \mapsto (g,g)} K_2^G(A[t]) \times K_2^G(A[t^{-1}]) \xrightarrow{(g_1,g_2) \mapsto g_1g_2^{-1}} K_2^G(A[t,t^{-1}])$$

is exact.

Proof. Follows from the above lemmas.

Corollary 6.5. Let A be any commutative ring, and let $f \in A[t]$ be a monic polynomial. Show that $K_2^G(A[t]) \to K_2^G(A[t]_f)$ is injective.

Proof. ????

Appendices

A. Linear Steinberg group in rank 3

The main goal of this subsection is to show that Tulenbaev's [Tul83, Lemma 2.3] remains valid for the linear Steinberg group of rank ≥ 3 . In order to do this we will need yet another presentation for the relative linear Steinberg group (cf. [Sin16, Definitions 3.3 and 3.7]).

Definition A.1. The relative Steinberg group $St^*(n, R, I)$ is the group defined by the following two families generators and four families of relations.

- Generators:
 - (1) $X^1(u,v)$, where $u \in E(n,R) \cdot e_1$, $v \in I^n$ such that $v^t \cdot u = 0$;
 - (2) $X^2(u,v)$, where $u \in I^n$, $v \in E(n,R) \cdot e_1$ such that $v^t \cdot u = 0$.

Notice that ϕ maps both $X^1(u,v)$ and $X^2(u,v)$ to $T(u,v)=e+u\cdot v^t\in E(n,R,I)$.

- Relations:
 - (1) $X^1(u,v) \cdot X^1(u,w) = X^1(u,v+w), u \in E(n,R) \cdot e_1, v,w \in I^n;$
 - (2) $X^{2}(u,v) \cdot X^{2}(w,v) = X^{2}(u+w,v), u,w \in I^{n}, v \in E(n,R) \cdot e_{1};$
 - (3) $X^{\sigma(u^2,v^2)}X^{\tau}(u^1,v^1) = X^{\tau}(T(u^2,v^2) \cdot u^1, T(v^2,u^2)^{-1} \cdot v^1), \ \sigma,\tau = 1,2;$
 - (4) $X^1(g \cdot e_1, g^* \cdot be_2) = X^2(g \cdot be_1, g^* \cdot e_2)$ where $b \in I$ and $g^* = g^{t-1}$ denotes the contragradient matrix.

Lemma A.2. The groups $St^*(n, R, I)$ and St(n, R, I) are isomorphic.

The next step of the proof is to is construct certain elements in St(n, R) similar to Tulenbaev's elements $X_{u,v}(a)$ see [Tul83, § 1].

Let $v \in R^n$ be a column. Denote by O(v) the submodule of R^n consisting of all columns w such that $w^t \cdot v = 0$. A column $w \in R^n$ is called v-decomposable if it can be presented as a finite sum $w = \sum_{i=1}^p w^i$ such that each w^i has at least two zero entries and $v^t \cdot w^i = 0$. Denote by D(v) the submodule of O(v) consisting of all v-decomposable columns. For a column $v \in R^n$ denote by I(v) the ideal of R spanned by its entries v_1, \ldots, v_n .

Let $u, v, w \in \mathbb{R}^n$ be columns such that $w^t v = 0$. It is easy to check (cf. [Kal77, Lemma 3.2]) that

$$(uv) \cdot w = \sum_{i < j} w_{ij}$$
, where $w_{ij} = (w_i u_j - w_j u_i)(v_j e_i - v_i e_j) \in A^n$.

The above decomposition is called the *canonical* decomposition of $(uv) \cdot w$. In particular, this shows that the column $a \cdot w$ is always v-decomposable for $a \in I(v)$, $w \in O(v)$, i.e. $I(v) \cdot O(v) \subseteq D(v)$. It is also straightforward to check that $D(v) \subseteq D(bv)$, $b \cdot D(v) \subseteq D(v)$ for $b \in R$.

Denote by B^1 the subset of $R^n \times R^n \times R$ consisting of triples (u, v, a) such that $v^t \cdot u = 0$, $v \in D(u)$, $a \in I(u)$. Denote by B^2 the set consisting of triples (v, u, a) such that $(u, v, a) \in B^1$.

lem:Zfacts

Lemma A.3. Assume that $n \geq 4$. One can define two families of elements $Z^{\tau}(u, v, a)$, $\tau = 1, 2$ of the group St(n, R) parametrized by $(u, v, a) \in B^{\tau}$ satisfying the following properties:

- (1) $\phi(Z^{\tau}(u, v, a)) = e + uav^{t} \in E(n, R), (u, v, a) \in B^{\tau};$
- (2) $Z^1(u, v + w, a) = Z^1(u, v, a) \cdot Z^1(u, w, a);$
- (3) $Z^{2}(v+w,u,a) = Z^{2}(v,u,a) \cdot Z^{2}(w,u,a);$
- (4) for $\tau = 1, 2$ and $b \in R$ if $(u, vb, a), (ub, v, a) \in B^{\tau}$ then one has

$$Z^{\tau}(u, vb, a) = Z^{\tau}(u, v, ab) = Z^{\tau}(ub, v, a);$$

(5)
$${}^{g}Z^{\tau}(u, v, a) = Z^{\tau}(\phi(g) \cdot u, \phi(g)^* \cdot v, a), \ \tau = 1, 2, \ g \in St^{G}(n, R).$$

Proof. One constructs the elements $Z^1(u, v, a)$ in exactly the same way as Tulenbaev constructs his elements $X_{u,v}(a)$ (see definitions preceding [Tul83, Lemma 1.2]). Indeed, set

(A.1)
$$Z^{1}(v, w, a) = \prod_{k=1}^{p} X(v, a \cdot w^{k}), \quad Z^{2}(w, v, a) = \prod_{k=1}^{p} X(a \cdot w^{k}, v).$$

where X(u, v) denotes the elements defined by Tulenbaev before [Tul83, Lemma 1.1].

The correctness of this definition and all the assertions of the lemma (with the exception of the last one in the case n=4) can be proved by the same token as in [Tul83, Lemma 1.3]. \square

For the rest of this section a denotes a nonnilpotent element of R and $\lambda_a \colon R \to R_a$ is the morphism of principal localization at a.

lem:rk3rels

Lemma A.4. For any $g \in E(n, R_a)$ there exist $u, v \in R^n$ and sufficiently large natural numbers k, m such that the following facts hold:

- (1) $\lambda_a(u) = g \cdot a^k e_1$, $\lambda_a(v) = g^* \cdot a^k e_2$ and $u^t \cdot v = 0$;
- (2) $(u, v, a^m) \in B^1 \cap B^2$;
- (3) for $b \in R$ divisible by some sufficiently large power of a one has

$$Z^1(u, b \cdot v, a^m) = Z^2(b \cdot u, v, a^m).$$

Proof. It is straightforward to choose u and v satisfying the first requirement of the lemma. We can even choose u, v in such a way that $u \in D(v)$ and $v \in D(u)$. Indeed, notice that $I(u) = a^{k_1}$, $I(v) = a^{k_2}$ for some natural k_1 , k_2 hence for $u' = a^{k_2} \cdot u$ and $v' = a^{k_1} \cdot v$ one has

$$u' \in I(v) \cdot O(v) \subseteq D(v) \subseteq D(v'), \quad v' \in I(u) \cdot O(u) \subseteq D(u) \subseteq D(u'),$$

as required.

In fact, we can also choose two extra columns $x, y \in \mathbb{R}^n$ and a large natural p in such a way that vectors u, v, x, y additionally satisfy the following properties

$$\lambda_a(x) = g^* \cdot a^k e_3, \ \lambda_a(y) = g \cdot a^k e_3, \ y^t \cdot x = a^p \in R,$$
$$u^t \cdot x = 0, \ u^t \cdot v = 0, \ y^t \cdot v = 0,$$
$$(u, x, a^m) \in B^1, \ (y, v, a^m) \in B^2.$$

Now direct computation using Lemma A.3 shows that

$$\begin{split} Z^2(a^{m+p}b\cdot u,v,a^m) &= Z^2(b\cdot (e+a^m\cdot ux^t)y,(e-a^m\cdot xu^t)v,a^m)\cdot Z^2(-by,v,a^m) = \\ &= [Z^1(u,x,a^m),Z^2(b\cdot y,v,a^m)] = \\ &= Z^1(u,x,a^m)\cdot Z^1((e+a^mb\cdot yv^t)u,-(e-a^mb\cdot vy^t)x,a^m) = Z^1(u,a^{m+p}b\cdot v,a^m), \quad \Box \end{split}$$

hence the third assertion of the lemma follows.

Cor:tulmap Corollary A.5. [Tulenbaev's lemma] For $n \geq 4$ there is a map T_n so that the following diagram commutes.

Proof. Follows from Lemma A.4 by the same token as in [Tul83, Lemma 2.3]. \Box
